Nuclear Batteries blend naturally in a urban environment

J. Buongiorno MIT, Iain Macdonald ArtEZ

“...computational methods drive design”

Extensive use of Predictive Simulation have allowed granting of this ETOPS capability prior to the A350 entrance in service

www.youtube.com/user/WorlTop10

Extended range Twin Operations (ETOPS)
aka Engines Turning Or Passengers Swimming

My position in a nutshell

1. **LOW COST DISPATCHABLE ZERO CARBON ENERGY=NUCLEAR POWER** (*I assume we all agree on this point*)
2. I will try to convince you that **predictive Modeling and Simulation (M&S) based on High-fidelity methods** is absolutely necessary for the future of nuclear power
3. I will argue that while **the methods are mature**, their adoption in design and operation is where we need to work.
4. *I hope to stimulate your reactions*

New NPP require Digital Optimization

- **High-fidelity Digital Twins** are a key enabling technology supporting a broader need for **Digital Optimization**
- Taking the example of **current SMR** design we clearly see the lack of Optimization
 - ✓ Plants are smaller GENIII+
 - ✓ Onsite Labor hours per MWe for many SMRs are not different than large LWRs
 - ✓ Still require specialized equipment (RPV)

Estimated Numbers -
Prof Koroush Shirvan, MIT

New NPP require Digital Optimization

- **High-fidelity Digital Twins** are a key enabling technology supporting a broader need for **Digital Optimization**
- Taking the example of current SMR design we clearly see the lack of Optimization
 - ✓ Plants are smaller GENIII+
 - ✓ Onsite Labor hours per MWe for many SMRs are not different than large LWRs
 - ✓ Still require specialized equipment (RPV)
- The “**excuse**” is too often the regulatory environment → Regulators have come a long way

Nuclear Designers Often Invest less then Vacuum Cleaners Designers to optimize their flow efficiency.

Estimated Numbers -
Prof Koroush Shirvan, MIT

High-fidelity Digital Twins are necessary to design, deploy and operate cost-competitive Nuclear Power

Design, deploy

Operate

DIGITAL & MODEL BASED PROJECT DELIVERY

Enabler of energy
& Digital revolutions

COMPLEXITY IN ACTION: NUCLEAR NEW BUILD PROJECT

CONVERGENCE BETWEEN DATA AND SYSTEM ENGINEERING

CONVERGENCE BETWEEN MBSE & DATA

- Document to Data, Modelling of workflow, process, Project delivery design

ASSET INFORMATION HUB FOR DESIGN/CONSTRUCTION/COMMISSIONING

ASSET INFORMATION HUB FOR OPERATION & MAINTENANCE

THE CONCEPT OF DIGITAL TWIN @SYSTEM LEVEL

System based Digital Twin':

Digital Twin functionalities :

- Seeks out correlations and causality to anticipate risk
- Helps to understand how a particular strategy will impact delivery and its KPIs in the future, and in turn best mitigate the identified risk
- Calculates an 'PDM-based confidence index' for the delivery of the project
- Being able to capture lessons learnt from previous projects

Risk reduction

- Threshold-based alerts
- Anomaly detection
- Root-cause analysis
- Pattern recognition

Decision making

- Advanced visualisation
- What-if scenarios
- Optimisation under constraints
- Multi-agent modelling

Data science techniques

LESSONS LEARNT FROM OTHER SECTORS

THE SPATIAL CONTEXT : A INCREASING CHALLENGE

Affordable access to space :

- Breaking Space Launch "cost barrier" is a main enabler for future Space Economy

The need for speed :

- Challenging newcomers entering competition

AUTOMOTIVE SECTOR

Standardisation

Modularity

Collaboration & Lessons Learnt

RAILWAY SECTOR

Rolling Stock

Signaling Products

Infrastructure

Platform approach, Modularity

KEY MESSAGES

- ❑ Digital twin at System Level as an enabler of the Project Delivery Model
- ❑ Important to introduce MBSE and Data Centric Approach
- ❑ NLP, Artificial Intelligence used to structure the data and to automatize process/workflows/tasks
- ❑ Lessons learnt from other sectors important and digitalisation of lessons learnt will de-risk the project delivery
- ❑ Nuclear is at the beginning of its industrialization journey

Rolls-Royce SMR

NEA Workshop on Digital Transformation:
Opportunities and Challenges for the Nuclear Sector
27th / 28th May 2021

Dr Nigel Hart – Head of Digital

NUCLEAR AMRC

SMR Power Station

The Rolls-Royce
SMR is a modular
build **power station**,
**not a nuclear
reactor**

- ✓ Capital cost under **£1.8 Bn**
- ✓ Typical LCOE of electricity **c.£50 per MWh**
- ✓ **Compact site footprint**
- ✓ **60-year plant lifetime**
- ✓ **Adaptable design**

Integrated Modular Factory Built Power Plant

Low Cost Nuclear

- Use of proven Technology
- Simplified and Standardised Equipment
- Predictable and Repeatable

Deliverable Solution

- **Factory Built Commodity**
- **Site canopy for controlled site environment**
- **Maximize Productivity and Innovation across Fleet**

Investable Product

- **Factory solution to build out Fleet**
- **Significantly reduced construction risk**
- **Acceptable Completion Risk given commodity nature of product**

Innovation for benefit, not for innovation sake

Low Cost Nuclear

- Proven Technology
- Simplified and Standardised Equipment
- Predictable and Repeatable

Deliverable Solution

- Factory Built Commodity
- Minimise Construction Risk
- Maximise Productivity and Innovation across Fleet

Investable Product

- Factory solution to build out Fleet
- Significantly reduced construction risk
- Acceptable Completion Risk given commodity nature of product

A fleet approach can realise further savings to operators

- Rolls-Royce has extensive experience in Aerospace and Marine in monitoring customer assets to optimise performance
- All units can be monitored against the performance of other units and normalised for age and environmental factors
- Central Ops centre analysis will
 - Optimise performance across the fleet
 - Minimise downtime / increase capacity factor
 - Provide early insights into future demands during maintenance schedules
- Sharing of engineering capability across the fleet

Digitally connected units

Centrally monitoring Ops
centre

NEA Digital Transformation

An Operator/Owner View

Brett Plummer

Why Digital for Nuclear Plants

- Safety and Reliability – Decrease Risk – Decrease Cost
 - “The Human Challenges the Equipment, the Equipment Challenges the Human”
 - Human Performance Error Prevention
 - Self Diagnostics
 - Decision Making
 - Decrease Labor Cost
 - Efficiency in Planning

Why Digital for Nuclear Plants

- Safety and Reliability – Decrease Risk – Decrease Cost
 - Equipment
 - Single Point Vulnerability
 - Condition Based Maintenance – Predictive Analytics
 - Efficiency – Information – Common Platform
 - Trends – Common platform
 - Minimize Inspections and Testing
 - Predictability - Reliability

What is the Challenge for New Plants

- Vision for Future Nuclear
 - Digital Innovation in Development of SMRs
 - Do we need people in local control rooms?
 - Do we have a centralized support center? Big data
 - Do Humans manipulate equipment? Minimize HU events
 - Who do we hire for personnel? IT or typical engineering disciplines or a hybrid?
 - How often do Operators perform training? Level of simulation based on simplicity of the SMRs
 - What is the span of the Regulator? Can we use AI?
 - Who maintains design control?
 - How do we minimize cost?

What is the Challenge

- Barriers to Digitalization
 - Change is Bad – 40 years – Self looking
 - Infrastructure to Support a fleet – chicken and the egg
 - Qualification Process and Cost
 - Installing Digital Systems that are Sustainable
 - The Right Integrated Expertise – Design through Installation
 - Cost Effectiveness
